

Based on my years of experience, I believe the testing world should move beyond traditional labels like "Manual QA" or "Automation QA." ✂

A modern QA professional should be a well-rounded individual—bringing together skills from product management, project management, and scrum mastery, along with strong technical expertise, programming knowledge, and even DevOps understanding.

This holistic skill set is what truly defines a quality QA professional today. Products tested and automated by such individuals are not only reliable—they are absolutely unstoppable. 🚀
